Lab 2: STATIC LOCALIZATION

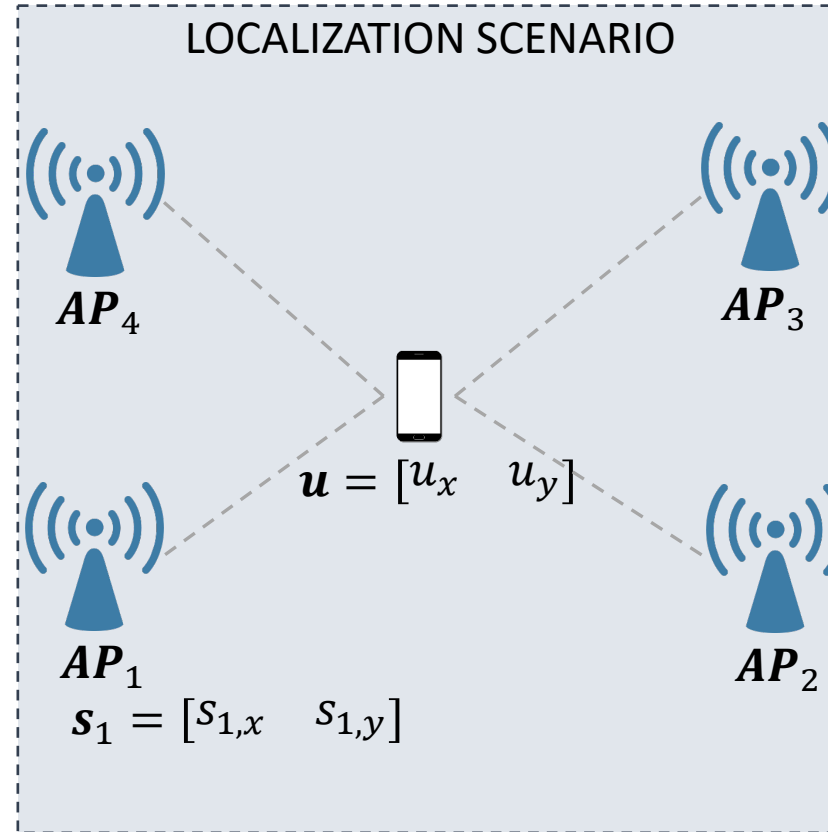

Cramér-Rao bound and iterative NLS

Mattia Brambilla

mattia.brambilla@polimi.it

2D localization: problem formulation

GOAL: localize an unknown user (UE) \mathbf{u} from a set of measurements $\boldsymbol{\rho}$ available at N_{AP} Access Points (APs).

The single measurement $\rho_i = h_i(\mathbf{u}, \mathbf{s}_i) + n_i$ is a non-linear function of the AP/UE states, corrupted by noise

non-linear
function states noise

CRB

Given a UE **true** position \mathbf{u} and its **estimate** $\hat{\mathbf{u}}$, the accuracy is defined as the error of the location estimate:

$$\Delta \mathbf{u} = \mathbf{u} - \hat{\mathbf{u}}$$

The Root Mean Square Error (RMSE) of the location estimate is:

$$\sigma_p = \sqrt{E[\Delta \mathbf{u}^2]} = \sqrt{\sigma_x^2 + \sigma_y^2} = \sqrt{\text{tr}(\mathbf{C})} \quad (\text{if unbiased estimator})$$

↓
covariance matrix

The covariance of the estimate (**C**) is lower bounded by the Cramér-Rao bound **C**_{CRB}.

The CRB is the inverse of the Fisher Information Matrix (FIM).

The FIM is defined as:

$$\mathbf{I}(\mathbf{u}) = \mathbf{H}^T(\mathbf{u})\mathbf{R}^{-1}\mathbf{H}(\mathbf{u}) \qquad \text{(Gaussian measurements)}$$

with

$$\mathbf{H}(\mathbf{u}) = \frac{\partial \mathbf{h}(\mathbf{u})}{\partial \mathbf{u}}$$

$$\text{Thus } \mathbf{C} \geq \mathbf{C}_{\text{CRB}} = \mathbf{I}^{-1}(\mathbf{u}) = \left(\mathbf{H}^T(\mathbf{u})\mathbf{R}^{-1}\mathbf{H}(\mathbf{u})\right)^{-1}$$

CRB: Gaussian measurements

23

For Gaussian measurements:

$\mathbf{n} \sim \mathcal{N}(\mathbf{0}, \mathbf{R}) \rightarrow \boldsymbol{\rho} \sim \mathcal{N}(\mathbf{h}(\mathbf{u}), \mathbf{R})$

we get:

$\mathbf{I}(\mathbf{u}_0) = \mathbf{H}^T \mathbf{R}^{-1} \mathbf{H}$

$\mathbf{C}_{\text{CRB}} = (\mathbf{H}^T \mathbf{R}^{-1} \mathbf{H})^{-1}$

where **H** is the NxM Jacobian matrix:

$$\mathbf{H} = \left. \frac{\partial \mathbf{h}(\mathbf{u})}{\partial \mathbf{u}} \right|_{\mathbf{u}=\mathbf{u}_0} = \begin{bmatrix} \frac{\partial h_1(\mathbf{u})}{\partial u_1} & \dots & \frac{\partial h_1(\mathbf{u})}{\partial u_M} \\ \vdots & \ddots & \vdots \\ \frac{\partial h_N(\mathbf{u})}{\partial u_1} & \dots & \frac{\partial h_N(\mathbf{u})}{\partial u_M} \end{bmatrix}_{\mathbf{u}=\mathbf{u}_0}$$

Proof:

$$\mathcal{L}(\boldsymbol{\rho} | \mathbf{u}) = -\frac{1}{2} \ln |\mathbf{R}| - \frac{1}{2} (\boldsymbol{\rho} - \mathbf{h}(\mathbf{u}))^T \mathbf{R}^{-1} (\boldsymbol{\rho} - \mathbf{h}(\mathbf{u}))$$

$$\frac{\partial \mathcal{L}(\boldsymbol{\rho} | \mathbf{u})}{\partial \mathbf{u}} = \mathbf{H}^T \mathbf{R}^{-1} (\boldsymbol{\rho} - \mathbf{h}(\mathbf{u}))$$

$$\mathbf{I}(\mathbf{u}) = E_{\boldsymbol{\rho}} \left[\frac{\partial \mathcal{L}(\boldsymbol{\rho} | \mathbf{u})}{\partial \mathbf{u}} \frac{\partial \mathcal{L}(\boldsymbol{\rho} | \mathbf{u})}{\partial \mathbf{u}}^T \right] = \mathbf{H}^T \mathbf{R}^{-1} E_{\boldsymbol{\rho}} \left[(\boldsymbol{\rho} - \mathbf{h}(\mathbf{u})) (\boldsymbol{\rho} - \mathbf{h}(\mathbf{u}))^T \right] \mathbf{R}^{-1} \mathbf{H} = \mathbf{H}^T \mathbf{R}^{-1} \mathbf{R} \mathbf{R}^{-1} \mathbf{H}$$

distribution

Error ellipse	Confidence level	Error ellipse	Confidence level
1σ	39.35%	1.18σ	50%
2σ	86.47%	1.79σ	80%
3σ	98.89%	2.15σ	90%
4σ	99.97%	2.45σ	95%

For $k\sigma$ ellipse :

$$P = F_{\chi^2_2}(k^2)$$

$$k = \sqrt{F_{\chi^2_2}^{-1}(P)}$$

$$\mathbf{C} = \begin{bmatrix} \sigma_x^2 & C_{xy} \\ C_{xy} & \sigma_y^2 \end{bmatrix}$$

How to get the orientation from \mathbf{C} : extract eigenvalues and corresponding eigenvector \Rightarrow SVD in Matlab

The axes of the ellipse are oriented as the eigenvectors, with length equal to the square root of eigenvalues.

- 1. Define the localization scenario (same as Lab 1)
- 2. Generate noisy measurements
- 3. Build covariance matrix **R**
- 4. Build Jacobian matrix **H(u)**
- 5. Calculate and plot the CRB ellipse

TDOA	$d_i - d_j = \mathbf{u} - \mathbf{s}_i - \mathbf{u} - \mathbf{s}_j $	$\frac{u_x - s_{i,x}}{d_i} - \frac{u_x - s_{j,x}}{d_j}, \frac{u_y - s_{i,y}}{d_i} - \frac{u_y - s_{j,y}}{d_j}$

Examples of expected results

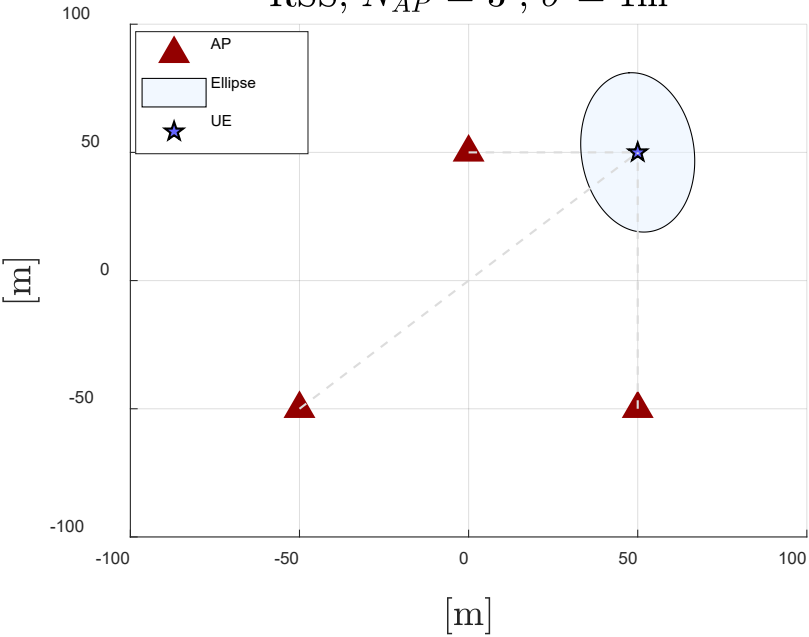

TOA, $N_{AP} = 3$, $\sigma = 10\text{m}$

AOA, $N_{AP} = 3$, $\sigma = 5\text{ deg}$

RSS, $N_{AP} = 3$, $\sigma = 1\text{m}$

$$a_{x1} = \frac{s_{1x} - u_x}{|\mathbf{s}_1 - \mathbf{u}|} = 1$$

$$a_{y1} = \frac{s_{1y} - u_y}{|\mathbf{s}_1 - \mathbf{u}|} = 0$$

$$a_{x2} = \frac{s_{2x} - u_x}{|\mathbf{s}_2 - \mathbf{u}|} = \frac{1/\sqrt{2}}{1} = \frac{1}{\sqrt{2}}$$

$$a_{y2} = \frac{s_{2y} - u_y}{|\mathbf{s}_2 - \mathbf{u}|} = \frac{1/\sqrt{2}}{1} = \frac{1}{\sqrt{2}}$$

$$\Delta_x = \sigma_n$$

$$\Delta_y > \Delta_x$$

$$\mathbf{H} = \begin{bmatrix} -1 & 0 \\ -1/\sqrt{2} & -1/\sqrt{2} \end{bmatrix}$$

$$\mathbf{H}^T \mathbf{H} = \begin{bmatrix} -1 & -1/\sqrt{2} \\ 0 & -1/\sqrt{2} \end{bmatrix} \begin{bmatrix} -1 & 0 \\ -1/\sqrt{2} & -1/\sqrt{2} \end{bmatrix} = \begin{bmatrix} 3/2 & 1/2 \\ 1/2 & 1/2 \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 3 & 1 \\ 1 & 1 \end{bmatrix}$$

$$\mathbf{G} = (\mathbf{H}^T \mathbf{H})^{-1} = 2 \begin{bmatrix} 1 & -1 \\ -1 & 3 \end{bmatrix} \frac{1}{3-1} = \begin{bmatrix} 1 & -1 \\ -1 & 3 \end{bmatrix} \quad D_x = 1; D_y = 3$$

$$\mathbf{C} = \sigma_n^2 \begin{bmatrix} 1 & -1 \\ -1 & 3 \end{bmatrix} \quad \sigma_x = 1\text{cm}; \sigma_y = 1.7\text{cm}$$

The semi-axes of the ellipse have length $\{\lambda_1, \lambda_2\}$ with $\{\lambda_1^2, \lambda_2^2\} = \text{eig}[\mathbf{C}]$.

Eigenvalue computation:

$$\mathbf{C} = \sigma_n^2 \begin{bmatrix} 1 & -1 \\ -1 & 3 \end{bmatrix}$$

$$\det(\mathbf{C} - \delta \mathbf{I}) = 0$$

$$\det \left(\begin{bmatrix} 1-\delta & -1 \\ -1 & 3-\delta \end{bmatrix} \right) = 0$$

$$(1-\delta)(3-\delta) - 1 = 0$$

$$\delta_1 = 3.41 \rightarrow \text{major semiaxis } \lambda_1 = \sqrt{3.41} = 1.8$$

$$\delta_2 = 0.58 \rightarrow \text{minor semiaxis } \lambda_2 = \sqrt{0.58} = 0.7$$

Angle of rotation of the ellipse:

$$\vartheta = \frac{1}{2} \arctan \frac{2C_{xy}}{\sigma_x^2 - \sigma_y^2} = \frac{1}{2} \arctan \frac{-2}{1-3} = \frac{45}{2} \text{ deg} = 22.5 \text{ deg}$$

ITERATIVE METHODS

We want to estimate the position $\hat{\mathbf{u}}$ from a set of measurements $\boldsymbol{\rho} = \mathbf{h}(\mathbf{u}) + \mathbf{n}$ of N_{AP}

$$\begin{aligned}\hat{\mathbf{u}} &= \operatorname{argmin} |\boldsymbol{\rho} - \mathbf{h}(\mathbf{u})|^2 \\ &= \operatorname{argmin} \sum_{i=1}^{N_{AP}} (\rho_i - h_i(\mathbf{u}))^2\end{aligned}$$

Numerical search algorithms: iterative NLS

11

- In the general case, there is no closed-form solution to the non-linear localization problem.
- Numerical search methods are used. A good initialization is required to avoid convergence to a local minimum of the loss function $F(\mathbf{u})$.
- In what follows we consider the iterative search of the NLS solution.

Iterative NLS

$$\hat{\mathbf{u}} = \arg \min_{\mathbf{u}} |\boldsymbol{\rho} - \mathbf{h}(\mathbf{u})|^2 = \arg \min_{\mathbf{u}} \sum_{i=1}^N (\rho_i - h_i(\mathbf{u}))^2$$

- Assume a solution is available from previous processing: $\hat{\mathbf{u}}^{(0)} = \begin{bmatrix} \hat{u}_x^{(0)} \\ \hat{u}_y^{(0)} \\ \hat{u}_z^{(0)} \end{bmatrix}$
- We linearize the system around the previous solution:

$$\mathbf{u} = \hat{\mathbf{u}}^{(0)} + \Delta \mathbf{u}; \quad \Delta \mathbf{u} = \begin{bmatrix} \Delta u_x \\ \Delta u_y \\ \Delta u_z \end{bmatrix} \quad \text{correction w.r.t. the previous solution}$$

$$h_i(u_x, u_y, u_z) \approx h_i(\hat{u}_x^{(0)}, \hat{u}_y^{(0)}, \hat{u}_z^{(0)}) + \left. \frac{\partial h_i(\mathbf{u})}{\partial u_x} \right|_{\hat{\mathbf{u}}^{(0)}} \cdot \Delta u_x + \left. \frac{\partial h_i(\mathbf{u})}{\partial u_y} \right|_{\hat{\mathbf{u}}^{(0)}} \cdot \Delta u_y + \left. \frac{\partial h_i(\mathbf{u})}{\partial u_z} \right|_{\hat{\mathbf{u}}^{(0)}} \cdot \Delta u_z$$

1. Start from an initial guess $\hat{\mathbf{u}}^{(0)}$
2. Compute $[\mathbf{H}(\mathbf{u})]_i = \frac{\partial h_i(\mathbf{u})}{\partial \mathbf{u}} \quad \forall i = 1, \dots, N_{AP}$
3. Evaluate $\Delta \rho_i^{(1)} = \rho_i - h_i(\hat{\mathbf{u}}^{(0)}) \quad \forall i = 1, \dots, N_{AP} \quad \longrightarrow \quad \Delta \boldsymbol{\rho}^{(1)} = \boldsymbol{\rho} - \mathbf{h}(\hat{\mathbf{u}}^{(0)})$
4. Compute $\Delta \mathbf{u}^{(1)} = \left(\mathbf{H}^{(1)\top} \mathbf{H}^{(1)} \right)^{-1} \mathbf{H}^{(1)\top} \Delta \boldsymbol{\rho}^{(1)}$
5. Update the estimate $\hat{\mathbf{u}}^{(1)} = \hat{\mathbf{u}}^{(0)} + \Delta \mathbf{u}^{(1)}$
6. Repeat 1-5 until a maximum number of iteration is reached or a threshold condition is satisfied

1. Start from an initial guess at previous iteration $\hat{\mathbf{u}}^{(k-1)}$
2. Compute $[\mathbf{H}(\mathbf{u})]_i = \frac{\partial h_i(\mathbf{u})}{\partial \mathbf{u}} \quad \forall i = 1, \dots, N_{AP}$
3. Evaluate $\Delta \rho_i^{(k)} = \rho_i - h_i(\hat{\mathbf{u}}^{(k-1)}) \quad \forall i = 1, \dots, N_{AP} \quad \longrightarrow \quad \Delta \boldsymbol{\rho}^{(k)} = \boldsymbol{\rho} - \mathbf{h}(\hat{\mathbf{u}}^{(k-1)})$
4. Compute the correction $\Delta \mathbf{u}^{(k)} = \left(\mathbf{H}^{(k)\text{T}} \mathbf{H}^{(k)} \right)^{-1} \mathbf{H}^{(k)\text{T}} \Delta \boldsymbol{\rho}^{(k)}$
5. Update the estimate $\hat{\mathbf{u}}^{(k)} = \hat{\mathbf{u}}^{(k-1)} + \Delta \mathbf{u}^{(k)}$
6. Repeat 1-5 until a maximum number of iteration is reached or a threshold condition is satisfied

1. Start from an initial guess at previous iteration $\hat{\mathbf{u}}^{(k-1)}$
2. Compute $[\mathbf{H}(\mathbf{u})]_i = \frac{\partial h_i(\mathbf{u})}{\partial \mathbf{u}} \quad \forall i = 1, \dots, N_{AP}$
3. Evaluate $\Delta \rho_i^{(k)} = \rho_i - h_i(\hat{\mathbf{u}}^{(k-1)}) \quad \forall i = 1, \dots, N_{AP}$
4. Compute the correction $\Delta \mathbf{u}^{(k)} = \left(\mathbf{H}^{(k)\top} \mathbf{R}^{-1} \mathbf{H}^{(k)} \right)^{-1} \mathbf{H}^{(k)\top} \mathbf{R}^{-1} \Delta \boldsymbol{\rho}^{(k)}$, with $\Delta \boldsymbol{\rho}^{(k)} = \left[\Delta \rho_i^{(k)} \right]_{i=1}^{N_{AP}}$
5. Update the estimate $\hat{\mathbf{u}}^{(k)} = \hat{\mathbf{u}}^{(k-1)} + \Delta \mathbf{u}^{(k)}$
6. Repeat 1-5 until a maximum number of iteration is reached or a threshold condition is satisfied

1. Define the localization scenario (copy&paste Lab 2)
2. Generate noisy measurements (copy&paste Lab 2)
3. Implement NLS
 - i. start from an initial guess $\hat{\mathbf{u}}^{(k)}$
 - ii. compute Jacobian matrix $\mathbf{H}(\hat{\mathbf{u}}^{(k)})$
 - iii. compute $h_i(\hat{\mathbf{u}}^{(k)})$
 - iv. correct and update the estimate
4. Plot the NLS iterations
5. Perform Monte Carlo simulations
6. Check the CRB

Examples of expected results
